AMENDMENTS TO THE SPECIFICATION

Please replace the paragraph beginning at page 16, line 1, with the following rewritten paragraph:

-- Examples of a resin constituting the thermoplastic resin layer include nylon (such as nylon-6 or nylon-66), polyester (such as polyethylene terephthalate or polybutylene terephthalate), polyolefin (such as polyethylene, ultrahigh molecular weight polyethylene, polypropylene or, ~~poly(4-methyl-1-pentene))~~ poly(4-methyl-1-pentene)), polystyrene, polyvinyl chloride, polyurethane, polysulfone, polyether ketone, polyether ether ketone, polyacetal, polyallylate, polyamide, polyamideimide, polycarbonate, modified polyphenylene ether, polyphenylene sulfide, polyacrylate, polymethyl methacrylate, polyether imide, polyether sulfone, polytetrafluoroethylene, a liquid crystal polymer and a thermoplastic elastomer. These can be used alone or in blend. A copolymer obtained from two or more monomers of these resins can also be used. Polyester, nylon and polyolefin are preferred. Nylon and polyolefin are especially preferred. This is because these resins have an excellent periodic damping property. --
